

619. Biggest Single Number

PLATFORM

Platform: LeetCode

DIFFICULTY

MEDIUM

DATE

Solved: June 22, 2026

Input

- 1 table — `MyNumbers` with column `num`
- No primary key — duplicates allowed

Output

- The **largest** number that appears **exactly once**
- Return `NULL` if no such number exists

Key Insights

- "Single number" = appears **exactly once** → use `GROUP BY` + `HAVING COUNT = 1`
- Need the **largest** among single numbers → wrap in `MAX()`
- `MAX()` on an **empty result** automatically returns `NULL` — no extra handling needed!

Observations

- Numbers appearing 2+ times are **excluded** entirely
- This is a **2-step problem**: filter first, then aggregate
- `MAX()` naturally handles the "no single number" edge case

Approach

1. **Inner query** → Group by `num`, count occurrences, keep only count = 1
2. **Outer query** → Take `MAX()` of that filtered list

Algorithm

Step 1: GROUP BY num
HAVING COUNT(num) = 1
→ gives all single numbers

Step 2: SELECT MAX(num) from Step 1 result
→ gives largest single number
→ if no rows, returns NULL automatically

619. Biggest Single Number Solved

SQL Schema Pandas Schema

Table: MyNumbers

Column Name	Type
num	int

This table may contain duplicates (In other words, there is no primary key for this table in SQL). Each row of this table contains an integer.

A **single number** is a number that appeared only once in the `MyNumbers` table. Find the largest **single number**. If there is no **single number**, report `null`. The result format is in the following example.

Example 1:

Input:

MyNumbers table:

8
8
3
3
1
4
5
6

Output:

6
