

183 – Customers Who Never Order

PLATFORM

Platform: LeetCode

DIFFICULTY

EASY

DATE

Solved: June 3, 2026

Problem

Find the names of customers who have never placed an order.

Concept Used: LEFT JOIN

A `LEFT JOIN` returns:

- All rows from the left table (`Customers`)
- Matching rows from the right table (`Orders`)
- `NULL` for right-table columns when no match exists

Step-by-Step

• Join Customers and Orders

```
Customers LEFT JOIN Orders
ON Customers.id = Orders.customerId
```

This keeps all customers, even those without orders.

• Identify Customers Without Orders

```
WHERE Orders.customerId IS NULL
```

If a customer has no matching order, the joined order columns become `NULL`.

• Select Customer Names

```
SELECT name
```

Returns only the names of customers who never ordered.

Key Interview Note

To find records in one table that **do not have matching records** in another table:

`LEFT JOIN ... WHERE right_table.column IS NULL`

The screenshot displays the LeetCode problem page for '183. Customers Who Never Order'. The problem is marked as 'Easy' and 'Solved'. The description asks for the names of customers who have never placed an order. The solution provided is a MySQL query using a LEFT JOIN between the Customers and Orders tables, filtering for orders that are NULL.

Table: Customers

Column Name	Type
id	int
name	varchar

id is the primary key (column with unique values) for this table. Each row of this table indicates the ID and name of a customer.

Table: Orders

Column Name	Type
id	int
customerId	int

id is the primary key (column with unique values) for this table. customerId is a foreign key (reference columns) of the ID from the Customers table. Each row of this table indicates the ID of an order and the ID of the customer who ordered it.

Write a solution to find all customers who never order anything.

Return the result table in **any order**.

The result format is in the following example.

Accepted 12 / 12 testcases passed

Runtime
545 ms | Beats 77.25%

Code

```
1 # Write your MySQL query statement below
2 SELECT name AS Customers
3 FROM Customers
4 LEFT JOIN Orders ON Customers.id = Orders.customerId
5 WHERE Orders.customerId IS NULL;
```

Testcase **Test Result**

Accepted Runtime: 95 ms

Case 1

Input

Customers =

id	name
1	Joe
2	Henry
3	Sam
4	Max

Orders =

id	customerId
1	3
2	1
